

# Social Media Sentiment Analysis for Product Feedback

Analyzing Textual Data for Sentiment Classification

**PRESENTED BY TEAM DATA NEXUS**

**05/02/2025**

# What is Sentiment Analysis?

---

Determining the emotional tone behind words to understand attitudes, opinions, and emotions.

## Why is it important?

- Assists businesses in understanding customer opinions.
- Enhances market research and product analysis.
- Supports informed decision-making.

# Methodology

## Scope:

- Utilize machine learning techniques for text classification and implement preprocessing steps to clean and prepare data.
- Evaluate model performance using appropriate metrics.

## Data Collection:

- Sourced from Kaggle dataset - <https://www.kaggle.com/datasets/kashishparmar02/social-media-sentiments-analysis-dataset/code>

## Data Preprocessing:

- Tokenization, stop-word removal, stemming/lemmatization.

## Model Development:

- Implemented Random Forest Classifier, Support Vector Classifier, Logistic Regression, Multinomial Naive Bayes

## Evaluation Metrics:

- Accuracy, Precision, Recall, F1-Score.

# Model Fitting

## 1. Logistic Regression

|              | precision | recall | f1-score | support |
|--------------|-----------|--------|----------|---------|
| 0            | 0.88      | 0.36   | 0.51     | 39      |
| 1            | 1.00      | 0.36   | 0.53     | 25      |
| 2            | 0.67      | 0.99   | 0.80     | 83      |
| accuracy     |           |        | 0.71     | 147     |
| macro avg    | 0.85      | 0.57   | 0.61     | 147     |
| weighted avg | 0.78      | 0.71   | 0.68     | 147     |

## 2. Naive Bayes

|              | precision | recall | f1-score | support |
|--------------|-----------|--------|----------|---------|
| 0            | 0.90      | 0.46   | 0.61     | 39      |
| 1            | 0.82      | 0.36   | 0.50     | 25      |
| 2            | 0.70      | 0.98   | 0.81     | 83      |
| accuracy     |           |        | 0.73     | 147     |
| macro avg    | 0.81      | 0.60   | 0.64     | 147     |
| weighted avg | 0.77      | 0.73   | 0.71     | 147     |

### 3. Random Forest

|  | precision | recall | f1-score | support |
|--|-----------|--------|----------|---------|
|--|-----------|--------|----------|---------|

|   |      |      |      |    |
|---|------|------|------|----|
| 0 | 0.87 | 0.51 | 0.65 | 39 |
|---|------|------|------|----|

|   |      |      |      |    |
|---|------|------|------|----|
| 1 | 0.90 | 0.36 | 0.51 | 25 |
|---|------|------|------|----|

|   |      |      |      |    |
|---|------|------|------|----|
| 2 | 0.72 | 0.99 | 0.83 | 83 |
|---|------|------|------|----|

|          |  |  |      |     |
|----------|--|--|------|-----|
| accuracy |  |  | 0.76 | 147 |
|----------|--|--|------|-----|

|           |      |      |      |     |
|-----------|------|------|------|-----|
| macro avg | 0.83 | 0.62 | 0.66 | 147 |
|-----------|------|------|------|-----|

|              |      |      |      |     |
|--------------|------|------|------|-----|
| weighted avg | 0.79 | 0.76 | 0.73 | 147 |
|--------------|------|------|------|-----|

## 4. Support Vector Machine

|              | precision | recall | f1-score | support |
|--------------|-----------|--------|----------|---------|
| 0            | 0.84      | 0.69   | 0.76     | 39      |
| 1            | 0.92      | 0.44   | 0.59     | 25      |
| 2            | 0.78      | 0.96   | 0.86     | 83      |
| accuracy     |           |        | 0.80     | 147     |
| macro avg    | 0.85      | 0.70   | 0.74     | 147     |
| weighted avg | 0.82      | 0.80   | 0.79     | 147     |

ROC Curves for All Models (Macro-Averaged, Multiclass)

**Model Accuracy Comparison:**

**Logistic Regression:**

**0.7142857142857143**

# Hypothesis Testing

ANOVA F-statistic: 0.02111944604731679

ANOVA P-value: 0.9791744555731762

Fail to reject the null hypothesis. Sentiment distribution does not vary significantly across platforms.

Likes by Platform

Retweets by Platform

```
-test results for Likes: Facebook vs Instagram
```

```
-statistic: -2.47173113257322
```

```

```

Hypothesis-**Is there a significant difference in likes/retweets across platforms?**

- Null Hypothesis: Mean engagement is the same on all platforms.
- Alternate Hypothesis: At least one platform differs in terms of mean user engagement.

Reject the null hypothesis. At least one sentiment group has a different average number of likes.

Hypothesis 2: Likes differ by Sentiment  
ANOVA p-value:  $1.2213705078053843e-17$

Hypothesis-**Do positive posts get more likes**

- Null Hypothesis: Likes differ significantly by sentiment. Positive posts get more likes than others.
- Alternate Hypothesis: Likes do not differ significantly by sentiment.

Reject the null hypothesis.  
At least one year has a  
different average sentiment  
score.

ANOVA p-value:

1.2213705078053843e-17

|          | sum_sq     | df      |
|----------|------------|---------|
| F        |            |         |
| PR(>F)   |            |         |
| C (Year) | 14.989815  | 13.0    |
|          | 1.717368   | 0.05303 |
| Residual | 482.074392 | 718.0   |
| NaN      | NaN        |         |

Hypothesis-**Does sentiment trend change over time**

- Null Hypothesis: The average sentiment scores are the same across all years.
- Alternate Hypothesis: At least one year has a different average sentiment score.

# Challenges and Solutions

## Challenges:

- Handling sarcasm and irony in text.
- Imbalanced dataset leading to biased predictions.

## Solutions:

- Incorporated advanced NLP techniques to detect sarcasm.
- Applied resampling methods to balance the dataset.

# THANK YOU
